# CHAPTER 1

---

## Quick Start Guide

---

## CHAPTER 2

---

### Command-line Interface

---

Relevant Nexus 3 API documentation:

- [REST API](#)
- [Script API](#)

## 3.1 NexusClient

**exception** `nexuscli.nexus_client.DownloadError`

Bases: `Exception`

**class** `nexuscli.nexus_client.NexusClient` (*url=None, user=None, password=None, config\_path=None*)

Bases: `object`

Interact with Nexus 3's API.

### Parameters

- **url** (*str*) – URL to Nexus 3 OSS service.
- **user** (*str*) – login for Nexus service at given url.
- **password** (*str*) – password for given login.
- **config\_path** (*str*) – local file containing configuration above in JSON format with these keys: `nexus_url`, `nexus_user` and `nexus_pass`.

**base\_url**

*str* – as per url argument.

**config\_path**

*str* – as per arguments.

**CONFIG\_PATH** =  `'/home/docs/.nexus-cli '`

**DEFAULT\_PASS** =  `'admin123 '`

**DEFAULT\_URL** = 'http://localhost:8081'

**DEFAULT\_USER** = 'admin'

**delete** (*repository\_path*, *\*\*kwargs*)

Delete artefacts, recursively if *repository\_path* is a directory.

**Parameters**

- **repository\_path** – location on the repository service.
- **kwargs** – implementation-specific arguments.

**Returns** number of deleted files. Negative number for errors.

**Return type** `int`

**download** (*source*, *destination*, *\*\*kwargs*)

Process a download. The source must be a valid Nexus 3 repository path, including the repository name as the first component of the path.

The destination must be a local file name or directory.

If a file name is given as destination, the asset may be renamed. The final destination will depend on `self.flatten`: when `True`, the remote path isn't reproduced locally.

**Parameters**

- **source** – location of artefact or directory on the repository service.
- **destination** – path to the local file or directory.
- **flatten** – when `True`, the remote path isn't reproduced locally.
- **nocache** – Force download of a directory or artefact even if local copy is available and is up-to-date with the version available on Nexus.

**Returns** number of downloaded files.

**download\_file** (*download\_url*, *destination*)

Download an asset from Nexus artefact repository to local file system.

**Parameters**

- **download\_url** – fully-qualified URL to asset being downloaded.
- **destination** – file or directory location to save downloaded asset. Must be an existing directory; any exiting file in this location will be overwritten.

**Returns**

**list** (*repository\_path*)

List all the artefacts, recursively, in a given *repository\_path*.

**Parameters**

- **repository\_path** – location on the repository service.
- **kwargs** – implementation-specific arguments.

**Returns** list of artefacts

**Return type** `list`

**list\_raw** (*repository\_path*)

As per `list` but returns a generator of raw Nexus artefact objects

**read\_config** ()

**repositories***RepositoryCollection* – instance**rest\_url****scripts****set\_config** (*user, password, base\_url*)**split\_component\_path** (*component\_path*)

Splits a given component path into repository, directory, filename.

A Nexus component path for a raw directory must have this format:

repository\_name/directory[ (/subdir1) ... ] [ / | filename ]

A path ending in / means it represents a directory; otherwise it represents a filename.

```

>>> dst0 = 'myrepo0/dir/'
>>> dst1 = 'myrepo1/dir/subdir/'
>>> dst2 = 'myrepo2/dir/subdir/file'
>>> dst3 = 'myrepo3/dir/subdir/etc/file.ext'
>>> split_component_path(dst0)
>>> ('myrepo0', 'dir', None)
>>> split_component_path(dst1)
>>> ('myrepo1', 'dir/subdir', None)
>>> split_component_path(dst2)
>>> ('myrepo2', 'dir/subdir', 'file')
>>> split_component_path(dst3)
>>> ('myrepo3', 'dir/subdir/etc', 'file.ext')

```

**Parameters** **component\_path** (*str*) – the Nexus component path, as described above.**Returns** tuple of (repository\_name, directory, filename). If the given component\_path doesn't represent a file, filename is set to None.**Return type** tuple**upload** (*source, destination, \*\*kwargs*)

Process an upload. The source must be either a local file name or directory. The flatten and recurse options are honoured for directory uploads.

The destination must be a valid Nexus 3 repository path, including the repository name as the first component of the path.

**Parameters**

- **source** – location of file or directory to be uploaded.
- **destination** – destination path in Nexus, including repository name and, if required, directory name (e.g. raw repos require a directory).
- **recurse** – do not process sub directories for uploads to remote
- **flatten** – Flatten directory structure by not reproducing local directory structure remotely

**Returns** number of files uploaded.**upload\_directory** (*src\_dir, dst\_repo, dst\_dir, \*\*kwargs*)

Uploads all files in a directory, honouring options flatten and recurse.

**Parameters**

- **src\_dir** – path to local directory to be uploaded
- **dst\_repo** – destination repository
- **dst\_dir** – destination directory in dst\_repo

**Returns** number of files uploaded

**Return type** `int`

**upload\_file** (*src\_file*, *dst\_repo*, *dst\_dir*, *dst\_file=None*)

Uploads a single file to a Nexus repository under the directory and file name specified. If the destination file name isn't given, the source file name is used.

**Parameters**

- **src\_file** – path to the local file to be uploaded.
- **dst\_repo** – name of the Nexus repository.
- **dst\_dir** – directory under dst\_repo to place file in.
- **dst\_file** – destination file name.

**write\_config** ()

## 3.2 Exception

**exception** `nexuscli.exception.NexusClientAPIError`

Bases: `Exception`

**exception** `nexuscli.exception.NexusClientConfigurationNotFound`

Bases: `Exception`

**exception** `nexuscli.exception.NexusClientCreateRepositoryError`

Bases: `Exception`

**exception** `nexuscli.exception.NexusClientDownloadError`

Bases: `Exception`

**exception** `nexuscli.exception.NexusClientInvalidCredentials`

Bases: `Exception`

**exception** `nexuscli.exception.NexusClientInvalidRepository`

Bases: `Exception`

**exception** `nexuscli.exception.NexusClientInvalidRepositoryPath`

Bases: `Exception`

## 3.3 Repository

**class** `nexuscli.repository.model.Repository` (*repo\_type*, *\*\*kwargs*)

Bases: `object`

Creates an object representing a Nexus repository with the given format, type and attributes.

**Parameters**

- **name** (*str*) – name of the new repository.

- **format** (*str*) – format (recipe) of the new repository. Must be one of `data:nexuscli.repository.validations.KNOWN_FORMATS`.
- **blob\_store\_name** (*str*) –
- **depth** (*int*) – only valid when `repo_format=yum`. The repodata depth.
- **remote\_url** (*str*) –
- **strict\_content\_type\_validation** (*bool*) –
- **version\_policy** (*str*) –
- **write\_policy** (*str*) – One of `:py:data:`
- **layout\_policy** (*str*) – One of
- **ignore\_extra\_kwargs** (*bool*) – if True, raise an exception for unnecessary/extra/invalid kwargs.
- **repo\_type** – type for the new repository. Must be one of `nexuscli.repository.validations.KNOWN_TYPES`.
- **kwargs** – attributes for the new repository.

**Returns** the created repository

**Return type** *Repository*

#### configuration

**class** `nexuscli.repository.model.RepositoryCollection` (*client=None*)

Bases: `object`

A class to manage Nexus 3 repositories.

**create** (*repository*)

Creates a Nexus repository with the given format and type.

**Parameters** **repository** (*Repository*) –

**Returns** None

**delete** (*name*)

Delete a repository.

**Parameters** **name** – name of the repository to be deleted.

**get\_raw\_by\_name** (*name*)

Return the raw dict for the repository called *name*. Remember to *refresh()* to get the latest from the server.

**Parameters** **name** (*str*) – name of wanted repository

**Returns** the repository, if found.

**Return type** `dict`

**Raises** `IndexError` – if no repository named *name* is found.

**raw\_list** ()

A raw representation of the Nexus repositories.

**Returns** for the format, see [List Repositories](#).

**Return type** `dict`

**refresh()**

Refresh local list of repositories with latest from service. A raw representation of repositories can be fetched using `raw_list()`.

`nexuscli.repository.groovy.script_create_repo()`

`nexuscli.repository.validations.is_target_supported(target, value, known, supported)`

Validate whether the a target argument is known and supported. The `target` is only used to provide a friendlier message to the user. The given value is checked against known and supported.

**Parameters**

- **target** (*str*) – name of the target, as known to the end-user.
- **value** (*str*) – value of the target key.
- **known** (*list*) – known possible values for the target.
- **supported** (*list*) – values for the target supported by us.

**Raises**

- `ValueError` – if given value is not in known.
- `NotImplementedError` – if given value is not in supported.

`nexuscli.repository.validations.repository_args(repo_type, **kwargs)`

Validate that the combination of arguments for a `nexuscli.repository.model.Repository` is valid.

**Raises**

- `ValueError` – If the value of a given argument is invalid or unsupported, or if unrecognised keyword arguments are given.
- `TypeError` – If the type of a given argument has the wrong object type.
- `NotImplementedError` – If the combination of arguments isn't yet supported.

**Parameters**

- **repo\_type** – as given to `:py:meth:`nexuscli.nexus_repository.Repository.create()`
- **kwargs** – as given to `:py:meth:`nexuscli.nexus_repository.Repository.create()`

`nexuscli.repository.validations.upcase_policy_args(args)`

Forces upper-case on the value of the `layout_policy`, `write_policy` and `version_policy` keys of a kwargs dict.

**Parameters** **args** (*dict*) – kwargs given to caller

**Returns** a copy of the original dict with the updated values.

**Return type** *dict*

## 3.4 Script

**class** `nexuscli.script.model.Script`

Bases: *object*

**class** `nexuscli.script.model.ScriptCollection(client=None)`

Bases: *object*

A class representing a Nexus 3 script.

**create** (*script\_dict*)

```

create_if_missing (script_dict)
delete (script_name)
get (name)
list ()
run (script_name, data=")

```

## 3.5 Util

`nexuscli.nexus_util.calculate_hash` (*hash\_name*, *file\_path\_or\_handle*)

Calculate a hash for the given file.

### Parameters

- **hash\_name** (*str*) – name of the hash algorithm in hashlib
- **file\_path\_or\_handle** (*Union[str, file object]*) – source file name (*str*) or file handle (from `open()`) for the hash algorithm.

**Returns** the calculated hash

**Return type** *str*

`nexuscli.nexus_util.filtered_list_gen` (*raw\_response*, *term*=None, *partial\_match*=True)

Iterates over items yielded by `raw_response_gen`, validating that:

1. the *path* dict key is a *str*
2. the *path* value starts with *starts\_with* (if provided)

```

>>> r = [{
>>>     'checksum': {
>>>         'md5': 'd94b865aa7620c46ef8faef7059a311c',
>>>         'sha1': '2186934d880cf24dd9ecc578335e290026695522',
>>>         'sha256': 'b7bb3424a6a6(...)4113bc38fd7807528481a8ffe3cf',
>>>         'sha512': 'e7806f3caa3e(...)3caeb9bbc54bbde286c07f837fdc'
>>>     },
>>>     'downloadUrl': 'http://nexus/repository/repo_name/a/file.ext',
>>>     'format': 'yum',
>>>     'id': 'Y2xvdWRlcmEtbWVudlcj(...)mRiNWU0YjllZWQzMg',
>>>     'path': 'a/fake.rpm',
>>>     'repository': 'cloudera-manager']}
>>>
>>> for i in filtered_list_gen(r, starts_with='a/fake.rpm')
>>>     print(i['path'])
a/fake.rpm
>>> for i in filtered_list_gen(r, starts_with='b')
>>>     print(i['path'])
# (nothing printed)

```

### Parameters

- **raw\_response** (*iterable*) – an iterable that yields one element of a nexus search response at a time, such as the one returned by `_paginate_get()`.
- **term** (*str*) – if defined, only items with an attribute *path* that starts with the given parameter are returned.

- **partial\_match** (*bool*) – if True, include items whose artefact path starts with the given term.

**Yields** *dict* – items that matched the filter.

`nexuscli.nexus_util.validate_strings(*args)`

Checks that all given arguments have a string type (e.g. str, basestring, unicode etc)

**Parameters** *\*args* – values to be validated.

**Returns** True if all arguments are of a string type. False otherwise.

**Return type** *bool*
